

Live site and Static site Audit - Case Study

Resources loading data comparison

Live Site (Dynamic - WordPress)

- Loads multiple **render-blocking** resources
- Heavy dependency on:
 - Plugins (Elementor, forms, tracking scripts)
 - CSS/JS bundles loaded globally
- Higher number of network requests
- Slower **Time to First Byte (TTFB)** due to server-side processing (PHP + database queries)

Static Site

- Significantly fewer resources loaded
- No PHP, no database calls → **pre-rendered HTML**
- Reduced JavaScript footprint (only essential scripts retained)

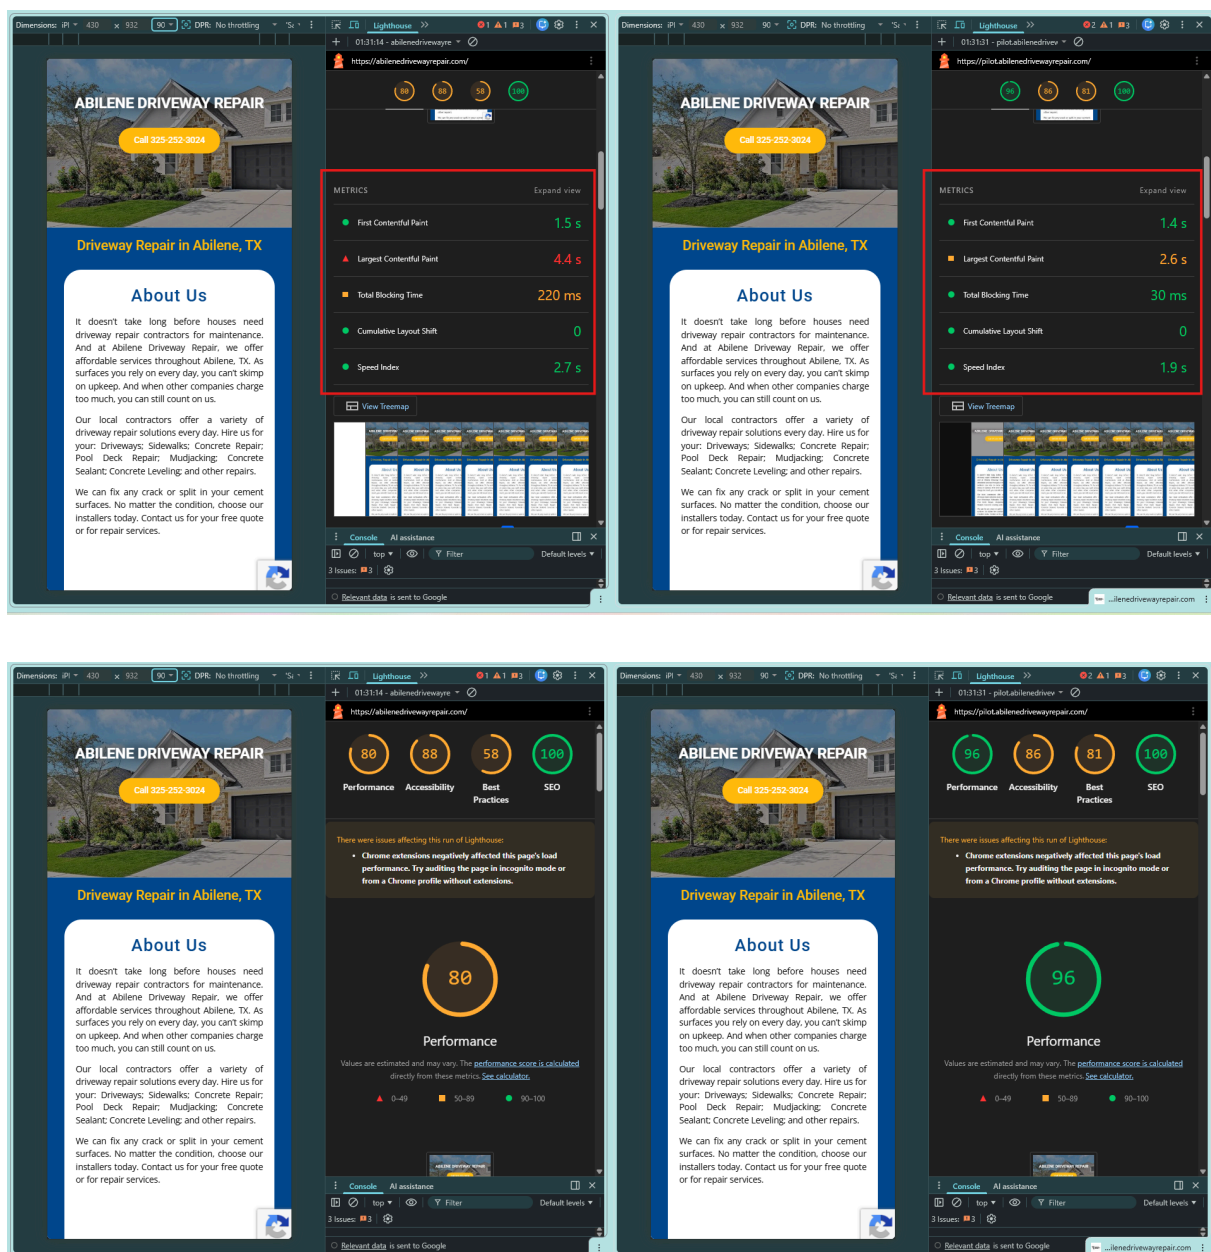

- Faster resource delivery via CDN (Cloudflare edge caching)

Key Insight

Static version eliminates backend overhead, resulting in:

- Faster initial load
- Reduced blocking resources
- More predictable performance

Lighthouse comparison (Site Speed) Mobile Appearance

Live Site Metrics

- Performance Score: ~80
- Largest Contentful Paint (LCP): ~4.4s
- Total Blocking Time (TBT): ~220ms
- Speed Index: ~2.7s

Static Site Metrics

- Performance Score: ~96
- LCP: ~2.6s
- TBT: ~30ms
- Speed Index: ~1.9s

Detailed Analysis

Largest Contentful Paint (LCP)

- Live: Delayed due to background images + CSS rendering (Divi/Elementor behavior)
- Static: Faster because content is pre-rendered and served instantly

Total Blocking Time (TBT)

- Live: Higher due to plugin JS execution
- Static: Minimal JS → faster interactivity

Speed Index

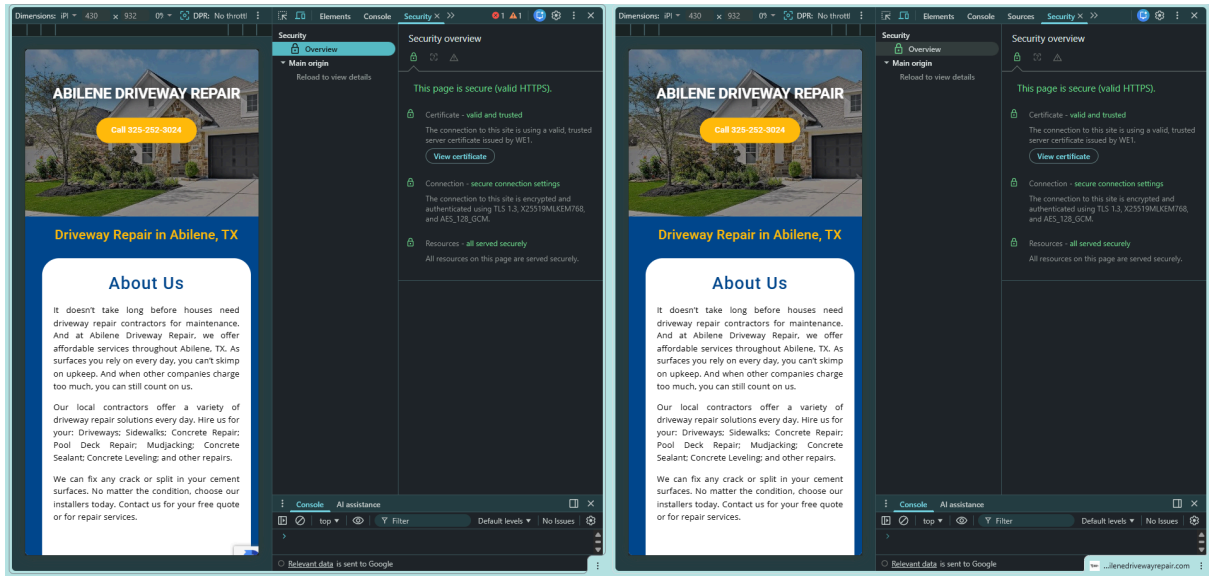

- Static loads visual content significantly faster

Conclusion

Static site achieves:

- ~40-50% faster load performance
- Better Core Web Vitals → improved SEO rankings potential

HTTPS security comparison

Live Site

- HTTPS enabled
- Standard SSL configuration
- Some dependency on hosting environment

Static Site

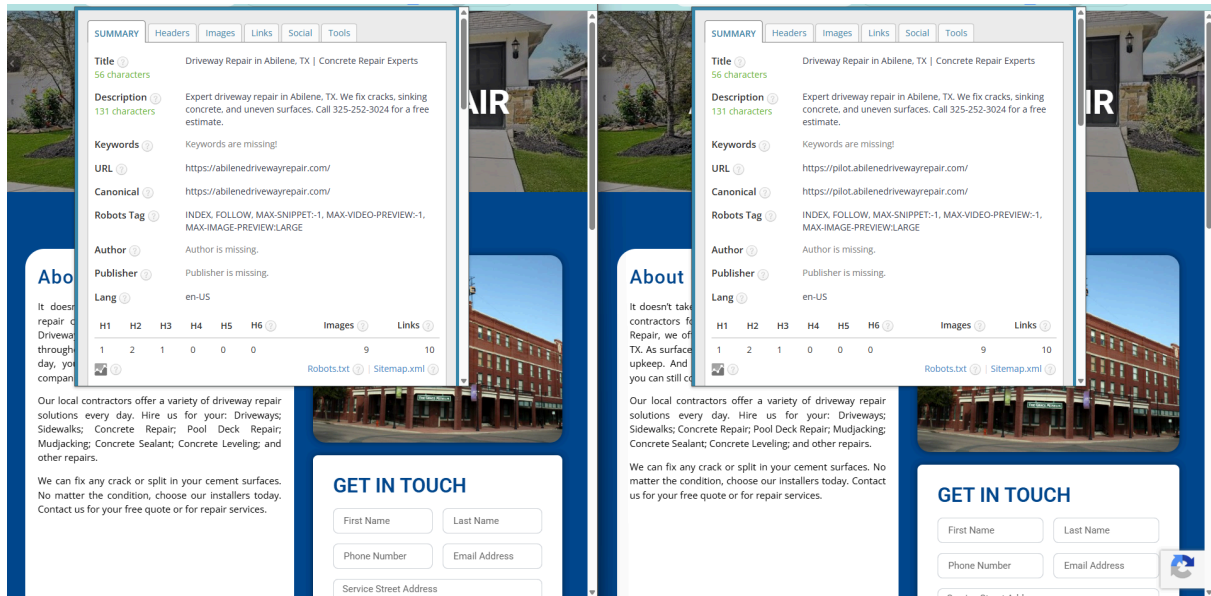

- HTTPS enforced via Cloudflare
- Edge-level security:
 - Automatic HTTPS redirection
 - Additional security headers (depending on config)
- More consistent SSL performance globally

Key Insight

Static sites benefit from **CDN-level security**, reducing:

- SSL misconfigurations
- Server-based vulnerabilities

SEO DATA Comparison (canonical, robot tag, meta tags)

Live Site

- Managed via SEO plugins (Yoast/Rank Math)
- Dynamic generation of:
 - Canonical tags
 - Meta descriptions
 - Robots directives

Static Site

- SEO data is **hardcoded or pre-generated**
- No plugin dependency
- Requires manual control or build-time injection

Important Observation

Both versions maintain:

- Proper canonical URLs
- Meta tags consistency
- Indexability

Risk in Static

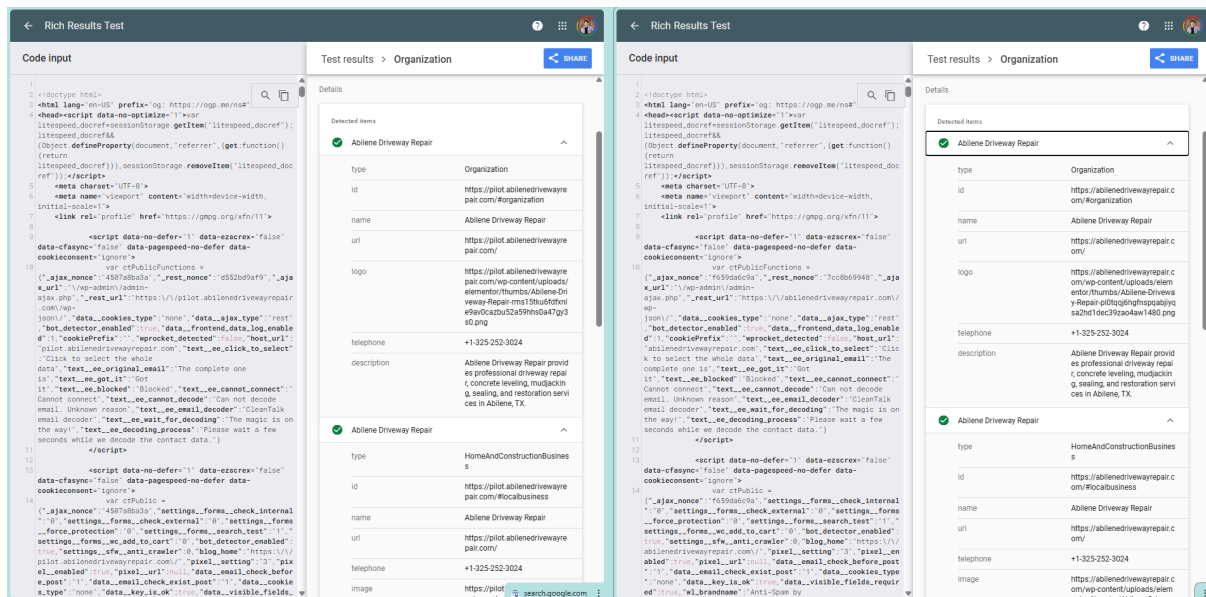

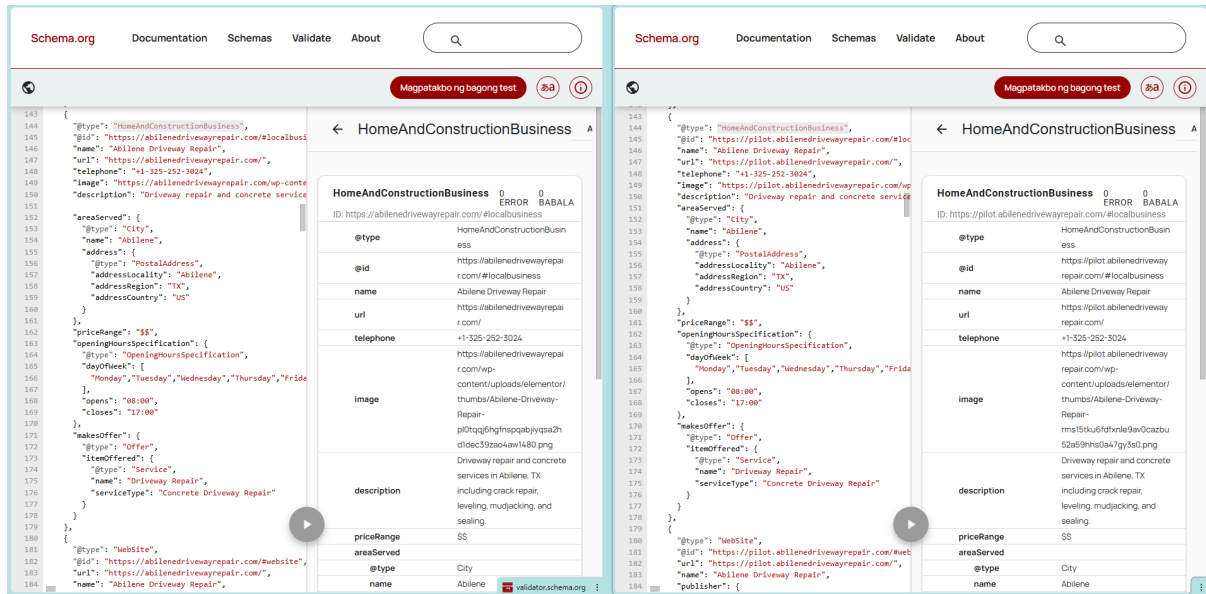

- If not maintained → SEO can break (no auto-updates like WP)

Conclusion

Static = stable but manual

Live = flexible but heavier

SCHEMA VALIDATOR (Schema Validator and Rich Snippets)

Live Site

- Schema generated via plugin or WPCode
- Dynamic injection (Organization, LocalBusiness, etc.)

Static Site

- Schema embedded directly in HTML
- No runtime generation

Validation Result

- Both versions successfully pass:
 - Schema.org validation
 - Rich Results test

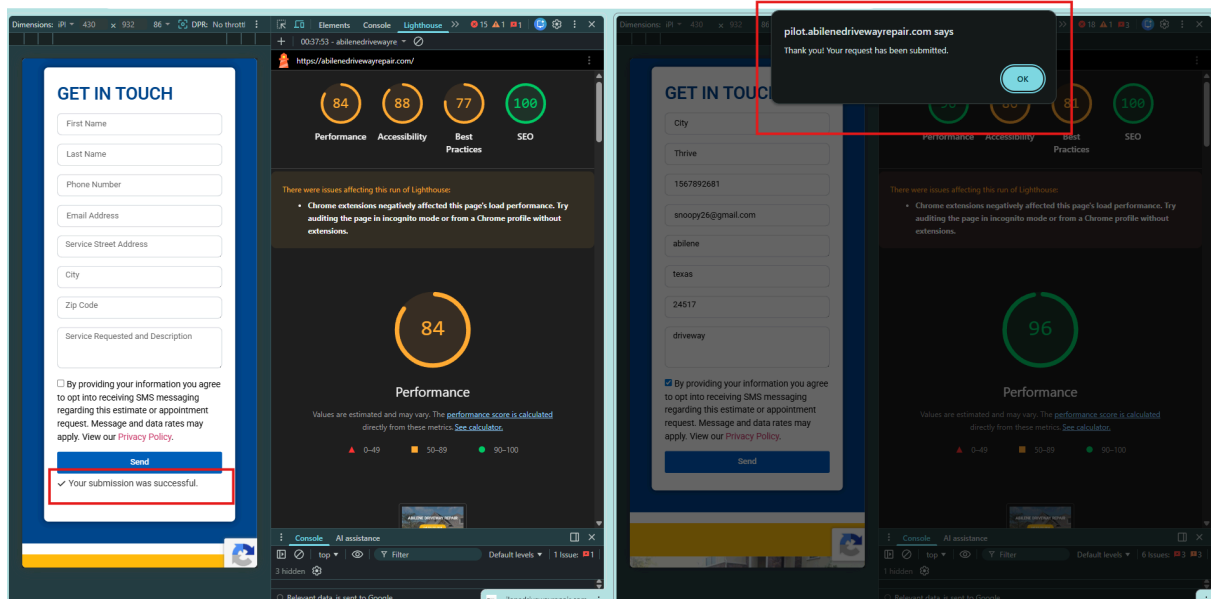

Key Insight

Static preserves schema effectively **if properly migrated**

Best Practice

- Always verify:
 - No duplicate schema
 - Correct URLs (pilot vs live mismatch is common issue)

FORM SUBMISSION

Company	Submission Time ▼	Form Name	Contact	Source	Referrer	Keywords	Camp →
Abilene Driveway Repair - Legacy Supportworks, Inc.	Apr 30 6:47pm	External Form https://abilenedrive...	City Thrive snoopy26@gmail.com	Direct	direct		 >
Abilene Driveway Repair - Legacy Supportworks, Inc.	Apr 30 6:45pm	External Form https://pilot.abilen...	City Thrive snoopy26@gmail.com	Direct	direct		 >

“Form tracking integrity was preserved across both environments, with successful submissions recorded in CallRail for both live and static implementations.”

Live Site (WordPress Form)

- Native Elementor form handling
- Validation:
 - Inline (inside fields)
- Submission:
 - Processed via backend (PHP)
- Reliable integration with tools like CallRail

Static Site

- No backend → requires custom solution:
 - JS validation
 - Cloudflare Worker (serverless validation)
- Validation behavior:
 - Popup alerts instead of inline errors
- Submission:
 - Routed via external endpoint (e.g., CallRail, webhook)

Key Differences

Feature	Live Site	Static Site
Validation	Inline field validation	JS popup validation
Backend	PHP processing	No backend
Spam	Plugin-based	Worker + Turnstile

Feature	Live Site	Static Site
Protection		(optional)
Reliability	Native	Custom (depends on setup)

Trade-Off Decision

Use Case	Recommended Approach
Performance-focused landing pages	Static
Content-heavy blog / CMS	Live
Lead-gen pages (with dev support)	Static + Worker
Non-technical management needed	Live
